CS680: Monte Carol Integration

Sung-Eui Yoon (윤성의)

Course URL: http://jupiter.kaist.ac.kr/~sungeui/SGA/

Course Administration

- HW
 - Due is this Thur.

Previous Time

- Radiometry
- Rendering equation

Two Forms of the Rendering Equation

Hemisphere integration

 $L(x \to \Theta) = L_e(x \to \Theta) + \int_{\Omega_x} f_r(\Psi \leftrightarrow \Theta) \cdot L(x \leftarrow \Psi) \cdot \cos \theta_x \cdot d\omega_{\Psi}$

Area integration

$$L(x \to \Theta) = L_{\varepsilon}(x \to \Theta) + \int_{A} f_{r}(\Psi \leftrightarrow \Theta) \cdot L(y \to -\Psi) \cdot \frac{\cos \theta_{x} \cdot \cos \theta_{y}}{r_{xy}^{2}} \cdot V(x, y) \cdot dA_{y}$$

Radiance Evaluation

- Fundamental problem in GI algorithm
 - Evaluate radiance at a given surface point in a given direction
 - Invariance defines radiance everywhere else

Radiance Evaluation

... find paths between sources and surfaces to be shaded

Why Monte Carlo?

Radiace is hard to evaluate

Sample many paths

- Integrate over all incoming directions
- Analytical integration is difficult
 - Need numerical techniques

- Numerical tool to evaluate integrals
- Use sampling
- Stochastic errors
- Unbiased
 - On average, we get the right answer

Probability

- Random variable x
- Possible outcomes: $x_1, x_2, x_3, ..., x_n$
 - each with probability: $p_1, p_2, p_3, \dots, p_n$
- E.g. 'average die': 2,3,3,4,4,5
 outcomes: x₁ = 2, x₂ = 3, x₃ = 4, x₃ = 5

- probabilities:

$$p_1 = 1/6, p_2 = 1/3, p_3 = 1/3, p_3 = 1/6$$

Expected value

Expected value = average value

$$E[x] = \sum_{i=1}^{n} x_i p_i$$

• E.g. die:

$$E[x] = 2 \cdot \frac{1}{6} + 3 \cdot \frac{1}{3} + 4 \cdot \frac{1}{3} + 5 \cdot \frac{1}{6} = 3.5$$

Variance

Expected 'distance' to expected value

 $\sigma^2[x] = E[(x - E[x])^2]$

• E.g. die:

$$\sigma^{2}[x] = (2-3.5)^{2} \cdot \frac{1}{6} + (3-3.5)^{2} \cdot \frac{1}{3} + (4-3.5)^{2} \cdot \frac{1}{3} + (5-3.5)^{2} \cdot \frac{1}{6}$$
$$= 0.916$$

• **Property**: $\sigma^{2}[x] = E[x^{2}] - E[x]^{2}$

Continuous random variable

- Random variable $x \in [a,b]$
- Probability density function (pdf) p(x)
- Probability that variable has value x: p(x)dx

Cumulative distribution function (CDF)
 – CDF is non-decreasing, positive

$$\Pr(x \le y) = CDF(y) = \int_{-\infty}^{y} p(x)dx$$

Continuous random variable

- Expected value: $E[x] = \int xp(x)dx$
 - $E[g(x)] = \int_{a}^{b} g(x)p(x)dx$
- Variance: $\sigma^{2}[x] = \int_{a}^{b} (x - E[x])^{2} p(x) dx$ $\sigma^{2}[g(x)] = \int_{a}^{b} (g(x) - E[g(x)])^{2} p(x) dx$
- Deviation: σ[x], σ[g(x)]

Continuous random variable

Probability that x belongs to $[a',b'] = Pr(x \le b') - Pr(x \le a')$

$$= \int_{-\infty}^{b'} p(x) dx - \int_{-\infty}^{a'} p(x) dx = \int_{a'}^{b'} p(x) dx$$

Uniform distribution

Uniform distribution

More than one sample

- Consider the weighted sum of N samples
- Expected value $E[\frac{1}{N}(x^1 + x^2 + x^3 + ... x^N)] = E[x]$

• Variance $\sigma^2[\frac{1}{N}(x^1 + x^2 + x^3 + ...x^N)] = \frac{1}{N}\sigma^2[x]$

Deviation

$$\sigma[\frac{1}{N}(x^{1} + x^{2} + x^{3} + \dots x^{N})] = \frac{1}{\sqrt{N}}\sigma[x]$$

More than one sample

- Consider the weighted sum of N samples $g(x) = \frac{1}{N} (f(x_1) + f(x_2) + f(x_3) + \dots + f(x_N))$
- Expected value

$$E[g(x)] = E[\frac{1}{N}\sum_{i=1}^{N} f(x_{i})] = E[f(x)]$$

- Variance $\sigma^2[g(x)] = \sigma^2[\frac{1}{N}\sum_i^N f(x_i)] = \frac{1}{N}\sigma^2[f(x)]$
- Deviation σ

$$\sigma[g(x)] = \frac{1}{\sqrt{N}} \sigma[f(x)]$$

Numerical Integration

• A one-dimensional integral:

$$I = \int_{a}^{b} f(x) dx$$

Deterministic Integration

Quadrature rules:

$$I = \int_{a}^{b} f(x) dx$$
$$\approx \sum_{i=1}^{N} w_{i} f(x_{i})$$

Primary estimator:

$$I = \int_{a}^{b} f(x) dx$$

$$I_{prim} = f(\overline{x})$$

$$E(I_{prim}) = \int_{0}^{1} f(x)p(x)dx = \int_{0}^{1} f(x)1dx = I$$

Unbiased estimator! © Kavita Bala, Computer Science, Cornell University 1

Unbiased estimator! © Kavita Bala, Computer Science, Cornell University

Monte Carlo Integration: Error

Variance of the estimator \rightarrow a measure of the stochastic error

More samples

More samples

· Expected value of estimator

$$E[\langle I \rangle] = E[\frac{1}{N} \sum_{i}^{N} \frac{f(x_{i})}{p(x_{i})}] = \frac{1}{N} \int (\sum_{i}^{N} \frac{f(x_{i})}{p(x_{i})}) p(x) dx$$
$$= \frac{1}{N} \sum_{i}^{N} \int (\frac{f(x)}{p(x)}) p(x) dx$$
$$= \frac{N}{N} \int f(x) dx = I$$

- on 'average' get right result: unbiased
- Standard deviation σ is a measure of the stochastic error $\sigma^{2} = \frac{1}{N} \int_{a}^{b} \left[\frac{f(x)}{p(x)} - I \right]^{2} p(x) dx$

MC Integration - Example

MC Integration - Example

Integral

$$I = \int_{0}^{1} 5x^{4} dx = 1$$

• Variance

MC Integration: 2D

• Primary estimator:

© Kavita Bala, Computer Science, Cornell University

MC Integration: 2D

Secondary estimator:

$$I_{\text{sec}} = \frac{1}{N} \sum_{i=1}^{N} \frac{f(\overline{x}_i, \overline{y}_i)}{p(\overline{x}_i, \overline{y}_i)}$$

- MC Integration works well for higher dimensions
- Unlike quadrature

$$I = \int_{a}^{b} \int_{c}^{d} f(x, y) dx dy$$

$$\left\langle I\right\rangle = \frac{1}{N} \sum_{i=1}^{N} \frac{f(x_i, y_i)}{p(x_i, y_i)}$$

Advantages of MC

• Convergence rate of $O(\frac{1}{\sqrt{N}})$

• Simple

- Sampling
- Point evaluation
- General
 - Works for high dimensions
 - Deals with discontinuities, crazy functions, etc.

MC Integration - 2D example

• Integration over hemisphere:

$$\begin{split} I &= \int_{\Omega} f(\Theta) d\omega_{\Theta} \\ &= \int_{0}^{2\pi\pi/2} \int_{0}^{2\pi\pi/2} f(\varphi, \theta) \sin \theta d\theta d\varphi \end{split}$$

$$\langle I \rangle = \frac{1}{N} \sum_{i=1}^{N} \frac{f(\varphi_i, \theta_i) \sin \theta}{p(\varphi_i, \theta_i)}$$

Hemisphere Integration example

Irradiance due to light source:

$$I = \int_{\Omega} L_{source} \cos \theta d\omega_{\Theta}$$
$$= \int_{0}^{2\pi\pi/2} \int_{0}^{2\pi\pi/2} L_{source} \cos \theta \sin \theta d\theta d\phi$$

$$p(\omega_i) = \frac{\cos\theta\sin\theta}{\pi}$$

$$\left\langle I\right\rangle = \frac{1}{N} \sum_{i=1}^{N} \frac{L_{source}(\omega_i) \cos\theta \sin\theta}{p(\omega_i)} = \frac{\pi}{N} \sum_{i=1}^{N} L_{source}(\omega_i)$$

© Kavita Bala, Computer Science, Cornell University

Importance Sampling

 Take more samples in important regions, where the function is large

MC integration - Non-Uniform

- Some parts of the integration domain have higher importance
- Generate samples according to density function p(x)

$$\langle I \rangle = \frac{1}{N} \sum_{i=1}^{N} \frac{f(x_i)}{p(x_i)}$$

- Estimator?
- What is optimal $p(\mathbf{x})$? $p(x) \approx f(x) / \int f(x) dx$

MC integration - Non-Uniform

• Generate samples according to density function p(x) $p(x) \approx f(x) / \int f(x) dx$

• Why?
$$I_{estimator} = \frac{1}{N} \sum \frac{f(x)}{p(x)} = \frac{1}{N} \sum \frac{f(x)}{f(x)/I} = \frac{1}{N} \sum I = I$$

$$\sigma^{2} = \frac{1}{N} \int_{a}^{b} \left[\frac{f(x)}{p(x)} - I \right]^{2} p(x) dx$$

• But....

 $=\frac{1}{N}\int_{-\infty}^{b} \left[\frac{f(x)}{f(x)/I} - I\right]^{2} p(x)dx = 0$

• Function:
$$I = \int_{0}^{4} x dx = 8$$

 $\sigma^{2} = \frac{1}{N} \int_{a}^{b} [\frac{f(x)}{p(x)} - I]^{2} p(x) dx$
 $p(x) = \frac{x}{8}, \sigma^{2} = 0$
 $I_{estimator} = I = 8$

$$p(x) = \frac{1}{4}, \sigma^2 = \frac{1}{N} \int_{0}^{4} \left[\frac{x}{1/4} - 8\right]^2 \frac{1}{4} dx = 21.3/N$$

$$p(x) = \frac{x+2}{16}, \sigma^2 = \frac{1}{N} \int_{0}^{4} \left[\frac{x}{(x+2)/16} - 8\right]^2 \frac{x+2}{16} dx = 6.3/N$$

Importance Sampling

Generate samples from density function p(x)

$$\left\langle I\right\rangle = \frac{1}{N} \sum_{i=1}^{N} \frac{f(x_i)}{p(x_i)}$$

- Optimal $p(\mathbf{x})$? $p(x) \approx f(x) / \int f(x) dx$
- General principle:
 - Closer shape of p(x) is to shape of f(x), lower the variance
- Variance can *increase* if p(x) is chosen badly

Sampling according to pdf

- Inverse cumulative distribution function
- Rejection sampling

Inverse Cumulative Distribution Function – Discrete Case

Continuous Random Variable

Algorithm

- Pick u uniformly from [0, 1)
- Output $y = P^{-1}(u)$, where $P(y) = \int_{-\infty}^{y} p(x) dx$

Non-Uniform Samples

 1) Choose a normalized probability density function p(x)

Non-Uniform Samples

- 1) Choose a normalized probability density function p(x)
- 2) Integrate to get a cumulative probability distribution function P(x):

$$P(x) = \int_{0}^{x} p(t)dt$$

Note this is similar to computing $\sum_{j=1}^{r} p_{j}$

Non-Uniform Samples

- 1) Choose a normalized probability density function p(x)
- 2) Integrate to get a probability distribution function P(x):

$$P(x) = \int_{0}^{x} p(t)dt$$

• 3) Invert *P*:

$$x = P^{-1}(\xi)$$

Note this is similar to going from y axis to x in discrete case! © Kavita Bala, Computer Science, Cornell University

Cosine distribution

$$f = \frac{1}{\pi} \int_{0}^{2\pi} \int_{0}^{1} \cos \theta \sin \theta d\theta d\phi$$
$$p(\theta, \phi) = \frac{\cos \theta \sin \theta}{\pi}$$
$$CDF(\theta, \phi) = \int_{0}^{\theta} \int_{0}^{\phi} \frac{\cos \theta \sin \theta}{\pi} d\theta d\phi = (1 - \cos^{2} \theta) \frac{\phi}{2\pi}$$
$$F(\theta) = 1 - \cos^{2} \theta$$
$$F(\phi) = \frac{\phi}{2\pi}$$
$$\phi_{i} = 2\pi\xi_{1}^{\xi} \qquad \theta_{i} = \cos^{-1} \sqrt{\xi_{2}}$$

Rejection Method

- Often not possible to compute the inverse of cdf
- Pick ξ₁, ξ₂

$$I = \int_{a}^{b} f(x) dx$$

- If ξ₂ < f(ξ₁), select ξ₁
- Is this efficient? What determines efficiency? A(f)/A(rectangle)

Summary

- Monte Carlo integration
- Estimators
- Sampling non-uniform distribution
